

5B. Wildfire Resilience Strategy

Spacing of plantings within the wildfire buffer will consider slope and wildfire risk to build resilience.

The SDC Campus wildfire resilience strategy involves the following key components:

- Establish a **300-foot wide wildfire buffer** around the core campus on its western, northern and eastern perimeters. The buffer would consist of managed open space areas providing defensible space and transition from the core campus to surrounding open space habitat;
- Use **fire resilient materials** and **home hardening strategies** in new development (see illustration above);
- Design the site plan to facilitate efficient emergency evacuation by (1) constructing an **evacuation route to Highway 12** and (2) ensuring all residential neighborhoods have two points of access to an evacuation route.
